

**This product is ETL listed and suitable only for indoor dry locations.**

**NOTE:**

There are standard length cables (4 sets of 5 shorter cables that get progressively longer). There is a set of extra long length (4 sets of 5 longer cables-CCBL1628).

Take a cable and a piece of glass. Attach all cables after deciding your arrangement of color and hanging placements for each glass.

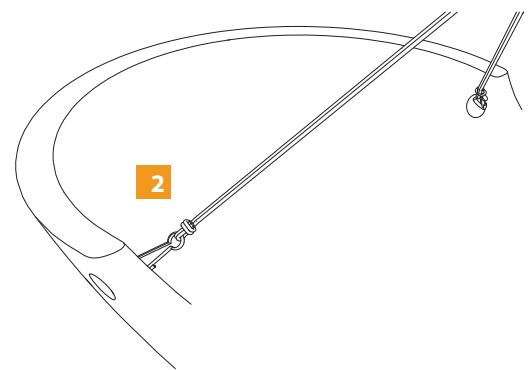

Do not attach cable to canopy until after attaching cable to glass. One end of each cable has a ring which goes to the canopy, Simply open ring and rotate until entire ring is attached to canopy.

## ATTACHING CABLE END TO GLASS

- 1** Take other end of cable and make a triangle to match the glass, two side arms and one long arm to end of glass.

- 2** Stick clip from inside of glass through glass hole and pull through. Now pull through enough to wrap cable around glass rim and reclip to cable inside of glass.

- 3** Pull gently to tighten cable around rim of glass. Center the loop on end of glass and take up any slack in cable loop.

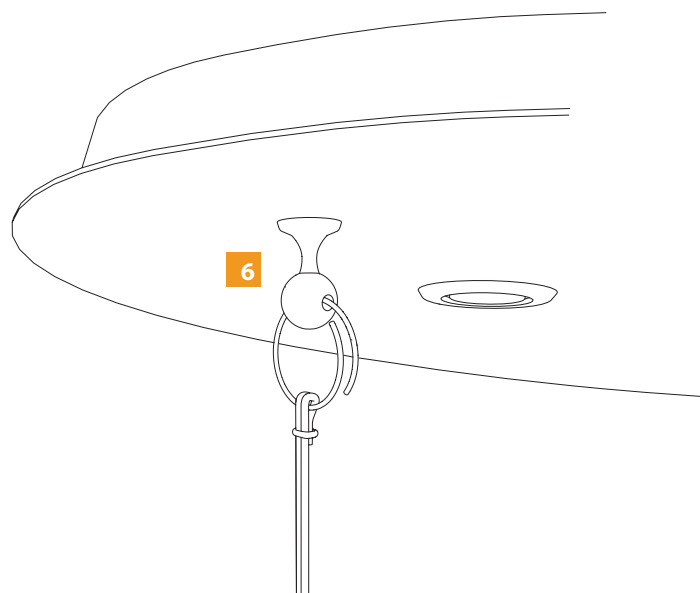

- 4** Take center metal ball with strain relief and center to a location in which when you hold up the cable from above the glass sits level. If it is not level all you need to do is slide the metal ball forward or back and the glass angle will change.

**5** Tighten set screw in ball and the cable assembly is complete.

**6** Hang glass and cable assembly in desired location on canopy.

**NOTE:**

It is best to hang the canopy with 2-3 persons to avoid unnecessary bending of metal.

It is meant to be flexible, but also should be kept from bending or twisting during installation process.

Thank you for choosing Stone Lighting

This canopy is tested in our facility and the lamps are tested and worked when they left our facility.
